

## **"Aqua TROLL" Water Quality Measurement System**

Aqua TROLL600 is a water quality monitoring instrument designed to measure and monitor various parameters in water bodies. It is developed by YSI, the United States.

The Aqua TROLL 600 of ENVF is equipped with multiparameter water quality sensors that can measure temperature, conductivity, dissolved oxygen, pH, ORP and Phycocyanin in water. The Aqua TROLL 600 is portable and configurable, making it suitable for various water environments, including rivers, lakes, reservoirs, and oceans. It can wirelessly or wiredly connect to a computer or mobile device for data transmission and analysis, enabling real-time monitoring and assessment of water quality.
